# Implementing Rhythmyx Web Services

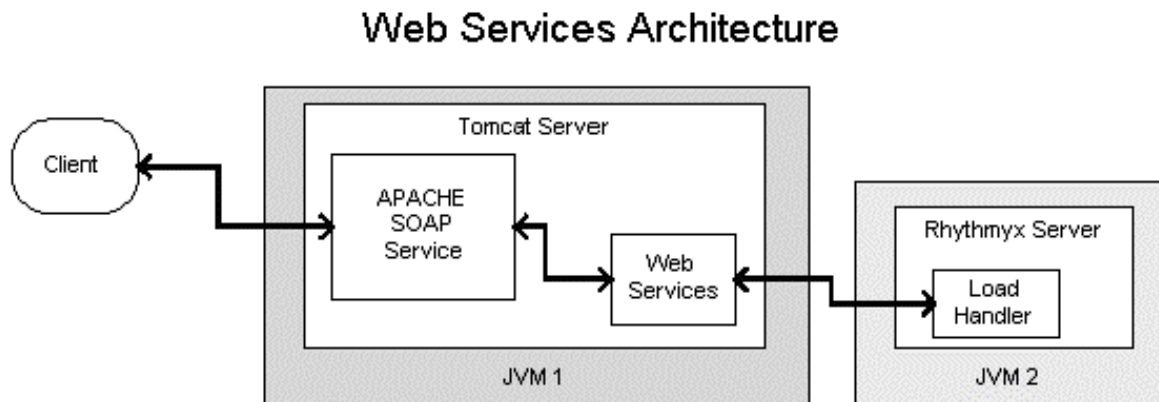

Rhythmyx Web Services adapts the Web Services model as an interface mechanism between the Rhythmyx server and remote applications.

---

NOTE: For an introduction to Rhythmyx functionality, see the *Rhythmyx Concepts Guide*.

---

Rhythmyx Web Services operates as a registered SOAP service on a J2EE application server. The application server receives incoming messages and Rhythmyx Web Services messages to the Rhythmyx Web Services server. The Rhythmyx Web Services service processes the messages, generating a series of requests to the Rhythmyx server, and packages the responses from Rhythmyx into a reply message it sends to the client application. The graphic below shows the general architecture of Rhythmyx Web Services:

*Figure 1: Rhythmyx Web Services Architecture*

The SOAP specification defines two models for communication, Remote Procedure Call (RPC) and Document-oriented XML messages. Rhythmyx uses the latter model because it permits dispatch and retrieval of attachments with the message. It also allows control over the SOAP header, which Rhythmyx uses to store authentication credentials. Remote Procedure Call does not allow either of these options.

Rhythmyx Web Services schemas are installed into the Rhythmyxroot/WebServices directory.

## Rhythmyx Web Services Overview

Rhythmyx Web Services are designed to provide third-party applications that can generate XML with an alternative interface to the functionality of Rhythmyx Content Explorer. This, not all Rhythmyx functionality is accessible through Web Services. Publishing, for example, is a Rhythmyx feature that is not accessible through Content Explorer; consequently, no Web Services methods are provided for Publishing.

The following categories of Web Services methods are available:

- Content Data
- Content Meta
- Workflow
- Design
- Search
- Folders
- Miscellaneous

### Content Management Methods

Rhythmyx Web Services includes two sets of methods that enable creation, maintenance, and management of Content Items. The first set of methods are the Content Data Functions. These methods facilitate the creation of new Content Items (New Item) opening an item or a portion of a item for editing (Open Item, Open Field, Open Child) and access to associated Content Items (Open Related). The Update Item method is used to upload modified Content Items to the Rhythmyx Repository, as well as to add new Content Items created using the New Item method to the Repository.

Two additional Content Data methods create clones of existing Content Items for various purposes. The Promotable Version method creates a clone that supercedes the original upon reaching a Public State (see below for details about the Public State). The New Copy method creates a clone that does not supercede the original. In both cases, the clones are unique Content Items, each with their own identifiers, that proceed through the Workflow independently of the original Content Item.

When a Content Item is Published, Rhythmyx sets a Revision Lock on it. Once this lock is set, every time a user uploads that Content Item to the Repository, it creates a new Revision of the Content Item. Rhythmyx always publishes the current Revision of the Content Item. The Promote Revision method is used to make a previous Revision of a Content Item the current Revision.

The second set of Web Services methods used in content management are the Content Meta functions. Two Content Meta functions are available. The Content Status method returns a set of metadata about the Content Item to the requestor. This metadata includes information such as title or description of the Content Item, its identifier, its current Workflow State, whether it is currently checked out, and which user has it checked out.

Text content is generally stored in the Repository as raw XML. To create formatted output, the XML must be merged with XSL formatting. In Rhythmyx, the set of XSL templates used to define the formatted output is called a Variant. In the process of associating Content Items to create output, users frequently need to see what the formatted output will look like. The Create Variant method, which is the only method in the set of Assembly Functions, returns a formatted Content Item to the requestor. The user can then see how the Content Item will look when it is published using that Variant.

## Workflow Methods

The life cycle of each Content Item is controlled by the Workflow assigned to it. A Workflow defines the business process for managing the life cycle of Content Items. In Rhythmyx, a Workflow consists of a series of States, or phases in the Workflow. Content Items move between States by making a Transition from one State to another. Rhythmyx Web Services accesses Workflows through the set of Workflow Functions. The Transition List method returns a list of Transitions available for the Content Item based on its current State. The Transition Item method is used to execute a Transition. Finally, an Audit Trail method returns a complete history of the Transitions a Content Item has made, including the name of the user that made the Transition and the date and time the Transition was executed.

## Design Methods

Design Functions serve a general purpose in content management. Content Items are classified into Content Types, which define the data and metadata fields included in the Content Item. The Content Type List method returns a list of Content Types defined in the system. This method is most commonly used in the process of creating new Content Items, when the user must select the Content Type of the new Content Item they want to create. The Variant List method is used when previewing Content Items. This method returns a list of Variants of the Content Type to the requestor. The user can then specify which Variant they want to preview, which is sent to the server using the Create Variant method described above.

## Search, Organization, and Navigation Methods

Users need to be able to find Content Items to maintain and manage them. Two sets of functions are available to help users locate Content. The first set, Search Services functions, consists of a single method, the Search Request method. This method is used to send a set of search parameters to the Rhythmyx server, which returns a list of Content Items.

It is far more efficient, however, for users to be able to define their methods of organizing Content Items to they can locate them. In Rhythmyx, organization and navigation is provided through a Folder functionality that mimics the folders in Windows Explorer. While files are physically stored in the Folders in Windows, in Rhythmyx, Folders provide a virtual organization mechanism. The physical Content Items are stored in the Repository; Folders only store pointers to the items.

Rhythmyx Web Services Folders functions provide a complete suite of Folder management functionality. Users can both create and delete Folders (Create Folder and Delete Folder methods), and modify the properties of a Folder (Update Folder method). They can list the contents of a Folder (Open Folder method), which may include both Content Items and additional Folders. User can add new contents to a Folder (Add Folder Children method), move them from one Folder to another (Move Folder Children method), copy contents of one Folder to another Folder (Copy Folder Children method), and remove contents from a Folder (Remove Folder Children method).

## Miscellaneous Methods

A final set of Miscellaneous Functions provides more generalized functionality for the system. This set of functions includes methods that are used to log in to the system (Login method) and to log out (Logout method). Rhythmyx uses a check in and check out function to restrict access to Content Items to one user at a time. In Rhythmyx Web Services, the Checkout method and Checkin method are used to facilitate this functionality. The Lock Revision method sets the Revision flag on a Content Item; once this flag is set, Rhythmyx creates a new Revision every time the user uploads the item to the Repository. The last of the Miscellaneous Functions is the Call Direct method, which provides direct access to applications in the Rhythmyx server.

---

# Rhythmyx Web Services Messages

SOAP messages to Rhythmyx consist of two parts, the authentication header and the message body. The authentication header stores the user's authentication data. An authentication header looks something like the following code:

```
<s:Header>
  <Authentication>
    <Username>admin1</Username>
    <Password>demo</Password>
    <Options>
      <Option name="sys_community">10</Option>
      <Option name="sys_lang">en-us</Option>
    </Options>
  </Authentication>
</s:Header>
```

The authentication header must include the user's Rhythmyx username and password. Use the options node to pass additional information such as the user's Community in systems that use Communities.

The body of the SOAP message specifies the function request and the request parameters. The message body should look similar to the following code:

```
<s:Body>
  <openItem xmlns="urn:www.percussion.com/webservices/contentdata">
    <OpenItemRequest>
      <ContentKey contentId="302" revision="1"/>
      <IncludeChildren>false</IncludeChildren>
      <IncludeRelated>false</IncludeRelated>
      <IncludeBinary>true</IncludeBinary>
      <CheckOut>false</CheckOut>
    </OpenItemRequest>
  </openItem>
</s:Body>
```

The first child node of the SOAP message body specifies the Rhythmyx Web Services function, in this case, `openItem`.

The child nodes of the function node specify the parameters passed to Rhythmyx. In this case, the parameters are `Content Key`, `IncludeChildren`, `IncludeRelated`, `IncludeBinary`, and `CheckOut`.

The complete SOAP message resembles this code:

```
<s:Envelope xmlns:s="http://schemas.xmlsoap.org/soap/envelope/">
  <s:Header>
    <Authentication>
      <Username>admin1</Username>
      <Password>demo</Password>
      <Options>
        <Name>sys_community</Name>
        <Value>local</Value>
      </Options>
    </Authentication>
  </s:Header>
```

```
<SOAP-ENV:Body>
  <m:openItem xmlns:m="http://www.percussion.com/wsd1/">
    <m1:ContentKey/>
    <m2:IncludeChildren>1</m2:IncludeChildren>
    <m2:IncludeRelated>1</m2:IncludeRelated>
    <m2:IncludeBinary>1</m2:IncludeBinary>
    <m2:CheckOut>1</m2:CheckOut>
  </m:openItem>
</SOAP-ENV:Body>
```

## CHAPTER 2

# Rhythmyx Web Services Functions

Content Service functions fall into the following categories:

- *Content Data* (see "[Content Data Functions](#)" on page 10)
- *Content Meta* (see "[Content Meta Functions](#)" on page 35)
- *Assembly* (see "[Assembly Functions](#)" on page 31)
- *Workflow* (see "[Workflow Functions](#)" on page 25)
- *Search* (see "[Search Service Functions](#)" on page 39)
- *Design* (see "[Design Functions](#)" on page 43)
- *Folders* (see "[Folders Functions](#)" on page 81)
- *Miscellaneous* (see "[Miscellaneous Functions](#)" on page 101)

---

# Content Data Functions

Content data functions permit the user to create and modify content managed through the Rhythmyx Content Management System.

## Schema: `sys_ContentDataParameters.xsd`

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_ContentDataParameters.xsd
<b>targetNamespace:</b>	http://www.percussion.com/schemas/sys_ContentDataParameters.xsd
<b>Elements</b>	
<i>OpenItemRequest</i> (see " <a href="#">Open Item</a> " on page 12)	
<i>OpenChildRequest</i> (see " <a href="#">Open Child</a> " on page 14)	
<i>OpenRelatedRequest</i> (see " <a href="#">Open Related</a> " on page 16)	
<i>OpenFieldRequest</i> (see " <a href="#">Open Field</a> " on page 18)	
<i>NewItemRequest</i> (see " <a href="#">New Item</a> " on page 11)	
<i>NewCopyRequest</i> (see " <a href="#">New Copy</a> " on page 19)	
<i>UpdateItemRequest</i> (see " <a href="#">Update Item</a> " on page 20)	
<i>PromoteRevisionRequest</i> (see " <a href="#">Promote Revision</a> " on page 22)	

## New Item

This function creates a blank template of the Content Type, which the user fills in with data and inserts into the Repository to create a new item.

This function is equivalent to selecting *Content > New > Item* in Content Explorer. It is used when a user wants to create a new Content Item from scratch (rather than by cloning an existing Content Item).

The XML document returned by this function contains empty elements for all complex child fields and all parent fields that do not have a default value. If a parent field has a default value, the element associated with that field includes the default value.

The `contentType` parameter specifies which content on which to base the new document. The name of the Content Type is the preferred value for this parameter, but the Rhythmyx server can also accept the numeric ID.

### Schema `sys_ContentDataParameters.xsd`

Element `NewItem`

Children	NewItemRequest

Element `NewItem/NewItemRequest`

Diagram	
Children	ContentType

Element `NewItem/NewItemRequest/ContentType`

Diagram	
---------	---

### Example Request Message Body

```
<s:Body>
  <NewItem xmlns="urn:www.percussion.com/webservices/contentdata">
    <NewItemRequest>
      <ContentType>article</ContentType>
    </NewItemRequest>
  </NewItem>
</s:Body>
```

## Example Request Reponse Body

See *Item Response* (on page 110)

### Errors

- No Content Type matching the value specified in the contentType parameter (Error Code: 13002)  

```
<com:Result errorCode="13002" type="failure">An invalid content type id was supplied to an operation: artle</com:Result>
```
- User issuing request is not in the same Community as the Content Type (Error Code: 14016)  

```
<com:Result errorCode="14016" type="failure">14016: Content type with id=3 is not visible to the community with id=10</com:Result>
```

## Open Item

The Open Item function retrieves the Content Item data for the specified Content Item from the Repository.

This function is equivalent to choosing *Edit* from an Action Menu in Content Explorer. It is used when a user wants to open the Content Item to modify its data.

The contentId attribute of the ContentKey must specify the ID of an existing Content Item. The revision attribute of the ContentKey specifies the Revision to retrieve. If the parameter has any other value, Rhythmyx returns the specified Revision. The dataVariant attribute of the ContentKey is not currently in use.

If the value of the includeChildren flag is true, Rhythmyx includes all complex children in the returned data. If the value of the includeRelated flag is true, Rhythmyx includes Dependent Content Items in Relationships in the Active Assembly Category (Active Assembly and Active Assmebly - Mandatory). If the value of the includeBinary flag is true, Rhythmyx includes data from each binary field as a base-64-encoded string.

If the value of the checkOut flag is true, Rhythmyx checks the Content Item out to the user issuing the request. If the value of the revision parameter of the Content Key is -1, Rhythmyx checks out the tip Revision. If the value of the revision parameter is any other value, Rhythmyx checks out the specified revision and promotes it to the tip revision. (This combination provides the same effect as the *Promote Revision* (on page 22) function.)

        <IncludeBinary>true</IncludeBinary>
        <CheckOut>false</CheckOut>
    </OpenItemRequest>
</openItem>
</s:Body>

```

## Example Request Reponse Body

See *Item Response* (on page 110)

## Errors

- No match for Content Key (Error Code: 14001)  
`<com:Result errorCode="14001" type="failure">Content item not found, contentId = 302, revision = 1.</com:Result>`
- Cannot check out complete item (Error Code 14506)  
`<com:Result errorCode="14506" type="failure">Cannot check out Content Item, contentId = 302, revision = 1.</com:Result>`

## Open Child

This function returns all complex children of the specified Content Item.

Essentially, this method acts as the *OpenItem method* (see "Open Item" on page 12) with the includeChildren flag set to true (includeChildren=true) and all other flags set to false. This function is equivalent to activating a Detail Editor in Content Explorer. Use it to open complex child table data for modification.

If you specify a revision other than the tip revision, Rhythmyx returns only the complex children associated with that revision. Any children of later revisions are not included.

The contentId attribute of the ContentKey must specify the ID of an existing Content Item. The revision attribute of the ContentKey specifies the Revision to retrieve. If the parameter has any other value, Rhythmyx returns the specified Revision. The dataVariant attribute of the ContentKey is not currently in use.

The childName parameter must match one of the fieldset names in the editor definition. If the children are ordered (in other words, if they have a value in the SORTRANK column of the child table), Rhythmyx adds them to the return document in the correct order.

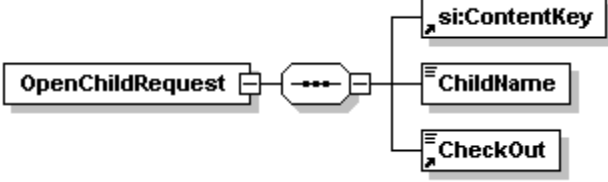

If the value of the checkOut flag is true, Rhythmyx checks the Content Item out to the user issuing the request. If the value of the revision parameter of the Content Key is -1, Rhythmyx checks out the tip Revision. If the value of the revision parameter is any other value, Rhythmyx checks out the specified revision and promotes it to the tip revision. (This combination provides the same effect as the *Promote Revision* (on page 22) function.)

```

<s:Body>
  <openChild xmlns="urn:www.percussion.com/webservices/contentdata">
    <OpenChildRequest>
      <ContentKey contentId="320" revision="1"/>
      <ChildName>Contributors</ChildName>
      <CheckOut>1</CheckOut>
    </OpenChildRequest>
  </openChild>
</s:Body>

```

## Example Request Reponse Body

See *Item Response* (on page 110)

### Errors

- No match for Content Key (Error Code: 14001)

```
<com:Result errorCode="14001" type="failure">Content item not found,
contentId = 302, revision = 1.</com:Result>
```

- Cannot check out complete item (Error Code 14506)

```
<com:Result errorCode="14506" type="failure">Cannot check out Content
Item, contentId = 302, revision = 1.</com:Result>
```

## Open Related

This function retrieves a Content Item and all related Content Items.

Essentially, this method acts as the *OpenItem method* (see "Open Item" on page 12) with the includeRelated flag set to true (includeRelated=true) and all other flags set to false. It is equivalent to selecting *Edit* from the popup menu displayed from an Action Arrow in Site Explorer. It is used when a user wants to modify the related content associated with a Content Item.

The contentId attribute of the ContentKey must specify the ID of an existing Content Item. The revision attribute of the ContentKey specifies the Revision to retrieve. If the parameter has any other value, Rhythmyx returns the specified Revision. The dataVariant attribute of the ContentKey is not currently in use.

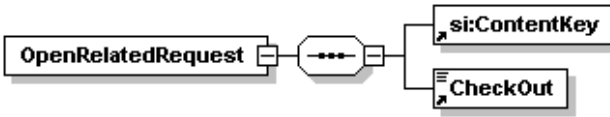

If the value of the checkOut flag is true, Rhythmyx checks the Content Item out to the user issuing the request. If the value of the revision parameter of the Content Key is -1, Rhythmyx checks out the tip Revision. If the value of the revision parameter is any other value, Rhythmyx checks out the specified revision and promotes it to the tip revision. (This combination provides the same effect as the *Promote Revision* (on page 22) function.)

```
<com:Result errorCode="14506" type="failure">Cannot check out Content
Item, contentId = 302, revision = 1.</com:Result>
```

## Open Field

This function retrieves a single data field rather than the entire Content Item, or retrieves the data for fields defined as binary. You can also use a query to return binary data.

This function is equivalent to activating a field for edit in Site Explorer. It is used when a user wants to modify the data for a specific field (rather than all of the data for the Content Item).

The `fieldName` parameter specifies the field to return. The `attachType` parameter defines the location of the data. Valid values for this parameter include:

- inline
- reference
- attachment

If the value of the `attachType` parameter is *reference*, Rhythmyx returns the URL of the item within the system rather than the binary item itself.

```
<com:Result errorCode="14001" type="failure">Content item not
found, contentId = 302, revision = 1.</com:Result>
```

**New Copy**

This function creates a new copy of the specified Content Item.

It is equivalent to selecting *Copy* from the Action menu for the selected Content Item in Content Explorer. It is used when a user wants to create a new clone of a Content Item that does not supercede the original upon going Public.

The contentId parameter must specify the ID of an existing Content Item. The value of this parameter must specify an existing Content Item. The revision parameter specifies the Revision to retrieve.

```
<com:Result errorCode="14001" type="failure">Content item not found, contentId = 302, revision = 1.</com:Result>
```

**Update Item**

This function modifies an existing Content Item in the Rhythmyx CMS or creates a new item.

It is equivalent to clicking the [**Update**] button on a Content Editor in Content Explorer. It is used when a user wants to upload a new Content Item or modifications to an existing Content Item to the Repository.

The data parameter contains an XML document that conforms to the schema sys\_StandardItem.xsd.

If you are updating an existing Content Item and the value of checkIn parameter is true, Rhythmyx checks the document in after modifying it. If an error occurs, the item is not checked in. If you are inserting a new content Item, Rhythmyx ignores this flag because, by default, inserting an item into the Repository sets the initial status of the item to not checked out.

**Schema sys\_ContentDataParameters.xsd**Element **UpdateItem**

<b>Diagram</b>

## Example Request Message Body

```

<s:Body>
  <updateItem
    xmlns="urn:www.percussion.com/webservices/contentdata">
    <UpdateItemRequest>
      <si:Item
        xmlns:si="urn:www.percussion.com/webservices/standarditem"
        contentType="1" revisionLock="false">
        <si:ContentKey contentId="302" revision="1"/>
        <si:Field>
          <si:FieldMeta displayName="System Title:"
            mimeType="text/plain" name="sys_title" showInPreview="true"
            sourceType="system" transferEncoding="none"/>
          <si:FieldValue>
            <si:RawData>Lorem ipsum dolor sut
            amut</si:RawData>
          </si:FieldValue>
        </si:Field>
      </si:Item>
      <CheckIn>false</CheckIn>
    </UpdateItemRequest>
  </updateItem>
</s:Body>

```

## Example Request Reponse Body

See *Item Response* (on page 110)

## Errors

- Rhythmyx cannot insert the Content Item; may occur for a variety of reasons; for example:
 

```

<com:Result errorCode="2014" type="failure">The 'contentType'
attribute of the <si:Item> XML element is invalid or empty:
</com:Result>

```

```
<com:Result errorCode="13219" type="failure">Validation error
occured while processing &quot;rxs_Generic_ce/Generic&quot;,
validation error is: &lt;?xml version=&quot;1.0&quot;
encoding=&quot;UTF-8&quot;?&gt;&lt;DisplayError
errorCount=&quot;1&quot;&gt; &lt;GenericMessage&gt;The following
field(s) produced validation errors:&lt;/GenericMessage&gt;
&lt;Details&gt;&lt;FieldError submitName=&quot;System
Title:&quot;&gt;&lt;/FieldError&gt;
&lt;/Details&gt;&lt;/DisplayError&gt;</com:Result>
```

If the parent insert fails, no further processing occurs. If a failure occurs when inserting a child or Related Content Item, processing continues.

- The checkin flag is set to true, but Rhythmyx cannot check in the Content Item (including all related Content Items):

```
<com:Result errorCode="1011" type="failure">An error occurred
while pre-processing the request submitted by the host (-not
available-). An exception occurred while processing the
&quot;Java/global/percussion/workflow/sys_wfAuthenticateUser&quot;
extension: com.percussion.security.PSAuthorizationException: Not
able to check-in item as an administrator has overridden your
checkout. You must go back and check-out the item again before
editing. (error code 1,108)</com:Result>
```

## Promote Revision

This function promotes a specified Revision of a Content Item to the current Revision.

It is equivalent to selecting *Promote* from the popup menu displayed from the Action Arrow in the Audit Trail in Content Explorer. It is used when a user wants to promote an earlier Revision to the current Revision.

The contentId parameter must specify an existing Content Item. The revision parameter specifies the Revision of that Content Item that you want to make the current Revision.

extension: com.percussion.security.PSAuthorizationException:
Operation not allowed while the content is checked out.. (error
code 1,108)</com:Result>

```

# Workflow Functions

Workflow functions allow the user to Transition Content Items within a Workflow and to review the Workflow Audit Trail of the item.

## Schema sys\_WorkflowParameters.xsd

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_WorkflowParameters.xsd
<b>TargetNamespace:</b>	http://www.percussion.com/schemas/sys_WorkflowParameters.xsd
<b>Elements</b>	
<i>AuditTrailRequest</i> (see " <a href="#">Audit Trail</a> " on page 29)	
<i>TransitionItemRequest</i> (see " <a href="#">Transition Item</a> " on page 26)	
<i>TransitionListRequest</i> (see " <a href="#">Transition List</a> " on page 25)	

## Transition List

This function retrieves a list of Transitions available for the specified Content Item, based on its current State. This list includes both the ID and the Name of each Transition. Each item in the list includes attributes that indicate:

- Whether a comment is required with the Transition.
- Which ad hoc users are valid, based on the Roles assigned to the Target States.
- Whether anonymous access is permitted for the State.

This function is an enhanced equivalent of the menu displayed when a user selects the *Workflow Action* Menu entry. It is used to call a list of available Transitions for a Content Item when a user wants to initiate a Transition to another State.

The value of the ContentKey must specify an existing Content Item.

## Schema sys\_WorkflowParameters.xsd

```
<com:Result errorCode="14001" type="failure">Content item not
found, contentId = 302, revision = 1.</com:Result>
```

**Transition Item**

This function changes the State of the specified Content Item in the Workflow.

It is equivalent to selecting an option under the Workflow menu in Content Explorer. It is used when a user wants to move a Content Item from one State to another.

Before executing the Transition, Rhythmyx checks the Content Item in.

The ContentKey must specify an existing Content Item.

The value of the transitionId parameter specifies the ID of the Workflow State to which the specified Content Item should move. The Transition List function retrieves the available values for this parameter.

The comment parameter stores the user's comment, which Rhythmyx adds to the Audit Trail when executing the Transition. Note that some Transitions require comments.

The `adhocUsers` parameter stores a comma-separated list of usernames to which the requesting user has assigned the Content Item.

# Assembly Functions

Assembly functions allow the user to work with an assembled page of data.

## Schema `sys_AssemblyParameters.xsd`

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_AssemblyParameters.xsd
<b>TargetNamespace:</b>	http://www.percussion.com/schemas/sys_AssemblyParameters.xsd
<b>Elements</b>	
<i>CreateVariantRequest</i> (see " <a href="#">Create Variant</a> " on page 31)	

## Create Variant

This function retrieves a fully-assembled Content Item.

It is equivalent to selecting an option under the Preview menu in Content Explorer. It is used when a user wants to preview a Content Item as assembled by a specific Variant.

The ContentKey must specify an existing Content Item. The revision attribute of the ContentKey parameter specifies the Revision to retrieve.

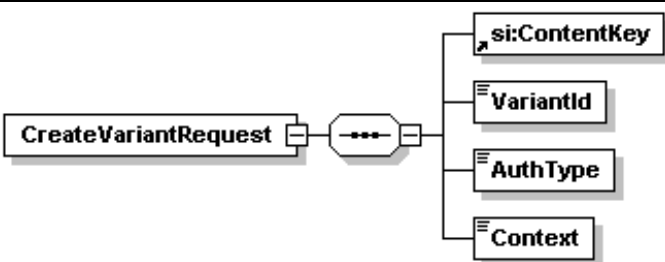

The variantId, authType, and context parameters determine the Variant to use to assemble the Content Item and define how Rhythmyx assembles it.

# Content Meta Functions

Content meta functions retrieve metadata about specific Content Items and the list of available Content Types when creating a new item.

## Schema `sys_ContentMetaParameters.xsd`

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_ContentMetaParameters.xsd
<b>targetNamespace:</b>	http://www.percussion.com/schemas/sys_ContentMetaParameters.xsd
<b>Elements</b>	
<i>ContentStatusRequest</i> (see " <a href="#">Content Status</a> " on page 36)	
<i>RevisionListRequest</i> (see " <a href="#">Revision List</a> " on page 37)	

## Content Status

This function retrieves the Rhythmyx metadata associated the specified Content Item.

It is equivalent to selecting *View > Properties* from an Action Menu in Content Explorer. It is used when a viewer wants to view the metadata of a Content Item.

The ContentKey parameter must specify an existing Content Item.

### Schema sys\_ContentMetaParameters.xsd

## Search Service Functions

Search functions provide the ability to retrieve lists of content items based on specified criteria. Search functions are flexible enough to allow any type of search the client needs. Predefined searches are also provided.

### Schema `sys_SearchParameters.xsd`

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_SearchParameters.xsd
<b>TargetNamespace:</b>	http://www.percussion.com/schemas/sys_SearchParameters.xsd
<b>Elements</b>	
<i>SearchRequest</i> (see " <a href="#">Search Request</a> " on page 39)	

## Search Request

The Search Request function searches for specific content items within the Repository. The search can use a pre-defined set of search criteria or custom criteria specified in the search request.

This function is equivalent to submitting a search from Content Explorer. It is used when a user wants to search for Content Items.

If the SearchName parameter has a value, the function uses the saved search query specified in the parameter to execute the search, based on the details defined in the searchParams parameter. This parameter stores a document defined by the Search.xsd schema. The schema includes standard field data, such as Title, ContentType, and Status. It also includes a list of FieldName/FieldValue pairs, an operator attribute for each pair specifying how to use the pair in the search, and a connector value specifying how to evaluate clauses.

The following fields are always returned, regardless of whether they were requested:

- sys\_contentid
- sys\_contenttypeid
- sys\_title
- sys\_workflowappid
- sys\_contentstateid
- sys\_contentcheckoutusername

The document in the searchParams parameter also includes a list of the fields to return. These fields may be the fields on which the search was executed or they may be other fields in the content item. The response also includes a set of default fields, includes contentId, revisionId, contentTypeId, state, contentstateid, author, checkedoutby, and title.

### Example Request Message Body

NOTE: This example message shows several of the search options available, including a named internal search and a variety of search parameters.

```
<s:Body>
  <search xmlns="urn:www.percussion.com/webservices/search">
    <SearchRequest>
      <SearchParams>
        <Title operator="like">Lorem Ipsum</Title>
        <ContentType>302</ContentType>-->
        <Parameter>
```

```

        <SearchField source="local" name="keywords"
operator="like">quand</SearchField>
        <SearchField source="system" name="sys_title"
operator="like" connector="and">Lorem Ipsum</SearchField>
        <SearchField source="system" name="sys_communityid"
operator="equal">10</SearchField>-->
    </Parameter>
    <SearchResults startIndex="1" endIndex="10">
        <SearchField source="system" name="sys_title"/>
        <SearchField source="system" name="sys_communityid"/>
        <SearchField source="system" name="sys_workflowid"/>
        <SearchField source="local" name="keywords"/>
    </SearchResults>
</SearchParams>
</SearchRequest>
</search>
</s:Body>

```

### Example Request Reponse Body

```

<SOAP-ENV:Body>
<SearchResponse endIndex="10"
xmlns="urn:www.percussion.com/webservices/search">
    <Result>
        <ResultField name="sys_currentrevision">1</ResultField>
        <ResultField name="sys_tiprevision">1</ResultField>
        <ResultField name="sys_contenttypeid">1</ResultField>
        <ResultField name="sys_contentid">303</ResultField>
        <ResultField name="sys_contentcheckoutusername"/>
        <ResultField name="sys_workflowid">1</ResultField>
        <ResultField name="sys_title">Copy (1) of Lorem ipsum dolor sit
amet</ResultField>
    </Result>
    <Result>
        <ResultField name="sys_currentrevision">1</ResultField>
        <ResultField name="sys_tiprevision">1</ResultField>
        <ResultField name="sys_contenttypeid">1</ResultField>
        <ResultField name="sys_contentid">314</ResultField>
        <ResultField name="sys_contentcheckoutusername"/>
        <ResultField name="sys_workflowid">1</ResultField>
        <ResultField name="sys_title">Copy (2) of Lorem ipsum dolor sit
amet</ResultField>
    </Result>
</SearchResponse>
</SOAP-ENV:Body>

```

### Errors

- Internal search, but specified saved search named in the searchName parameter cannot be found (Error Code: 14014)

```

<com:Result errorCode="14014" type="failure">Internal request
failed, path=sys_psxInternalSearches/Sample
Search.html.</com:Result>

```

## Design Functions

Design functions allow the user to retrieve information about the architecture of the Content Management System.

### Schema `sys_DesignParameters.xsd`

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_DesignParameters.xsd
<b>TargetNamespace:</b>	http://www.percussion.com/schemas/sys_DesignParameters.xsd
Elements	
<i>ContentTypeListRequest</i> (see " <a href="#">Content Type List</a> " on page 43)	
<i>ContentTypeRequest</i> (see " <a href="#">Content Type</a> " on page 44)	
<i>VariantListRequest</i> (see " <a href="#">Variant List</a> " on page 78)	

## Content Type List

This function retrieves a list of Content Types available to the user to create new Content Items.

In effect, it generates the list of Content Types displayed when a user Selects New Item from an Action Menu in Content Explorer. It is used to produce a list of available Content Types when a user wants to create a new Content Item.

</SOAP-ENV:Body>
```

## Errors

- None

## Content Type

This function retrieves a specific Content Type definition. Using this definition, the client can create a Content Type object, as defined by the CMS layer. This function is used primarily by remote clients.

It is used to create the framework for a Content Item when a user wants to create a new Content Item.

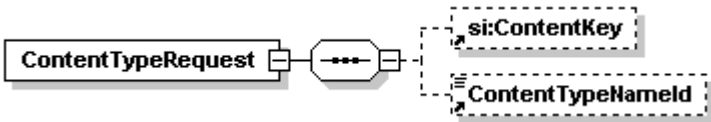

You must specify a value for either the ContentKey or the contentTypeNameId parameter. If the ContentKey includes a value, Rhythmyx returns all the Variants associated with the specified Content Item. If the contentTypeNameId parameter includes a value, Rhythmyx returns all Variants associated with the specified Content Type. If both parameters have a value, Rhythmyx returns all the Variants associated with the Content Type.

## Errors

- No Content Type matching the value specified in the contentType parameter (Error Code: 13002)
 

```
<com:Result errorCode="13002" type="failure">An invalid content type id was supplied to an operation: artle</com:Result>.
```
- User issuing request is not in the same Community as the Content Type (Error Code: 14016)
 

```
<com:Result errorCode="14016" type="failure">14016: Content type with id=3 is not visible to the community with id=10</com:Result>
```

## Variant List

This function retrieves a list of Variants. Each Variant returned includes both the Display Name and the Variant ID.

In effect, this function creates the list of Variants displayed in Content Explorer when a user selects *Preview* from an Action Menu. It is used when a user wants to preview a Content Item as formatted by a specific Variant.

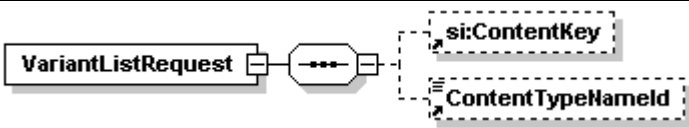

You must specify a value for either the ContentKey or the contentTypeNameId parameter. If the ContentKey includes a value, Rhythmyx returns all the Variants associated with the specified Content Item. If the contentTypeNameId parameter includes a value, Rhythmyx returns all Variants associated with the specified Content Type. If both parameters have a value, Rhythmyx returns all the Variants associated with the Content Type.

<com:Result errorCode="14001" type="failure">Content item not
found, contentId = 1500, revision = 1.</com:Result>

```

## Folders Functions

Folder functions are functions that manipulate and maintain folders and their contents in the Rhythmyx Content Explorer.

### Schema `sys_FolderParameters.xsd`

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_FolderParameters.xsd
<b>TargetNamespace:</b>	http://www.percussion.com/schemas/sys_FolderParameters.xsd
<b>Elements</b>	
	<i>AddFolderChildrenRequest</i> (see " <a href="#">Add Folder Children</a> " on page 91)

## Create Folder

This function creates a new folder using the name specified in the PSXFolder parameter. The name attribute of the Folder parameter cannot be NULL and must be unique within its container. If you want to restrict access to the Folder to a specific Community, you must specify that Community in the PSXFolderProperty child of the PSXLocator.

This function is equivalent to selecting *Content > New > Folder* in Content Explorer. It is used when a user wants to create a new Folder in Rhythmyx Content Explorer.

## Errors

- Value in the name attribute of the PSXFolder parameter is NULL, empty, or already exists in the container where the request originated (ERROR CODE 2004):

```

<com:Result errorCode="2014" type="failure">The 'name' attribute
of the &lt;PSXFolder&gt; XML element is invalid or empty:
</com:Result>

```

## OpenFolder

This function opens an existing folder. The FolderID parameter specifies the identifier of the Folder to open.

This function is equivalent to double-clicking on a Folder node in Content Explorer. It is used when a user wants to open a Content Explorer Folder to access the associated Content Items.

`<com:Result errorCode="14020" type="failure">A required folder id was missing for the webservice action 'openFolder'.</com:Result>`

## Get Folder Children

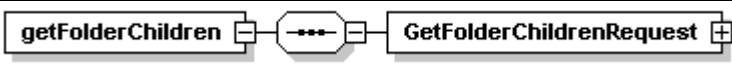

This method retrieves a list of the contents of the folder specified. It is equivalent to double-clicking on a Folder in Content Explorer. It is used to create a list of

The FolderId parameter specifies the ID of the folder whose contents Rhythmyx will return.

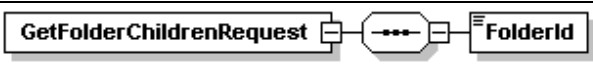

The list of returned objects includes both folders and Content Items. The returned data for each Content Item includes its Content ID, Content Type ID, and name or title. The returned data for each folder includes its ID and its name.

## Errors

- The value of the FolderId parameter is NULL or empty (ERROR CODE 14020):
 

```

<com:Result errorCode="14020" type="failure">A required folder id
was missing for the webservice action
'getFolderChildren'.</com:Result>

```
- No folder found with the specified identifier: a null results set is returned. Since a null results set is also returned for an empty folder, you may want to confirm that the requested Folder ID is, in fact, valid. One way to confirm the validity of the Folder ID is to submit an OpenFolder request for the same ID. If a "required Folder ID missing" error is returned, the Folder is invalid.

## Copy Folder Children

This function copies all contents of the specified folder to the target folder. It is equivalent to choosing *Copy* from the popup menu when dragging Folder content to another Folder in Content Explorer.

The `TargetParentId` parameter specifies the ID of the folder to which to add the copied children. The `ChildIds` parameter contains a list of children to copy. If the value of the `Recursive` parameter is true, Rhythmyx copies all of the contents of subfolders recursively. If the value of recursive is false, Rhythmyx only copies the contents of the specified folder.

`<com:Result errorCode="13136" type="failure">Failed to get meta data for content id(s): 3060.</com:Result>`

## Add Folder Children

This function adds the specified objects (both Content Items and folders) to the specified folder. It is equivalent to selecting *As Link* from the popup menu when dragging Folder contents to another Folder.

The TargetParentId Parameter specifies the folder to which to add the content. The ChildIds parameter specifies a list of objects to add to the specified folder. The ChildIds parameter may not be NULL, but can be empty.

### Schema sys\_FolderParameters.xsd

Element `addFolderChildren`

**Returns:** ResultResponse defined by the schema `sys_CommonParameters.xsd`.

### Example Request Message Body

```
<s:Body>
  <AddFolderChildren>
    <AddFolderChildrenRequest>
      <TargetParentId>418</TargetParentId>
      <ChildIds>
        <ChildId>437</ChildId>
      </ChildIds>
    </AddFolderChildrenRequest>
  </AddFolderChildren>
```

```
</s:Body>
```

## Example Request Response Body

See *Result Response (Successful Response)* (on page 114)

## Errors

- Rhythmyx cannot find the TargetParentId (ERROR CODE 13136)  

```
<com:Result errorCode="13136" type="failure">Failed to get meta data for content id(s): 1002.</com:Result>
```

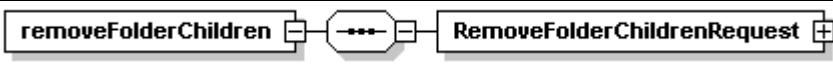

## Remove Folder Children

This function removes children, both Content Items and folders, from the specified folder. Any Relationships in deleted folders are also removed. This function only removes the folder Relationships. The actual Content Items are not deleted from the system.

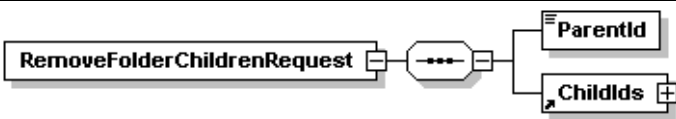

The ParentId parameter specifies the folder from which to remove the children. The ChildIds parameter specifies a list of IDs of objects to remove from the the specified folder. The ChildIds parameter may not be NULL, but can be empty.

**Returns:** ResultResponse defined by the schema `sys_CommonParameters.xsd`.

### Example Request Message Body

```
<s:Body>
  <removeFolderChildren>
    <RemoveFolderChildrenRequest>
      <ParentId>318</ParentId>
      <ChildIds>
        <ChildId>464</ChildId>
      </ChildIds>
    </RemoveFolderChildrenRequest>
  </removeFolderChildren>
</s:Body>
```

### Example Request Response Body

See *Result Response (Successful Response)* (on page 114).

### Errors

- Rhythmyx cannot find the TargetParentId (ERROR CODE 13136)  
`<com:Result errorCode="13136" type="failure">Failed to get meta data for content id(s): 1002.</com:Result>`

## Update Folder

This function modifies the attributes of the specified folder. It does not modify the contents of the folder. The Folder parameter specifies the folder whose properties Rhythmyx will update. The attributes of the Folder parameter specify the modifications to the folder attributes.

This function is the equivalent of using the Edit Folder dialog in Content Explorer.

</GetParentFolderResponse>

```

## Errors

- Rhythmyx cannot find the specified ChildID (ERROR CODE 13137)
 

```

<com:Result errorCode="13137" type="failure">Failed to get parent
folder, may be caused by invalid content id: 5000.</com:Result>

```

## Delete Folder

This function deletes the folder specified. All folders contained within the specified folder are deleted. All Folder Relationships in all deleted Folders are also deleted. The FolderId specifies the identifier of the Folder to delete. It cannot be NULL or empty.

This function is equivalent to choosing *Remove* from the popup menu when right-clicking on a folder node in Content Explorer.

### Schema sys\_FolderParameters.xsd

Element `deleteFolder`

### Errors

- Rhythmyx cannot find the FolderId (ERROR CODE 13136)  
<com:Result errorCode="13136" type="failure">Failed to get meta data for content id(s): 1002.</com:Result>

## Miscellaneous Functions

Miscellaneous functions are functions that do not fit within any of the other categories. In particular, the Call Direct function provides a "catch-all" function you can use to define your own functions. This method allows you to call a Rhythmyx application directly to retrieve data.

### Schema sys\_MiscellaneousParameters.xsd

<b>Schema Location:</b>	(Rhythmyx Root)\Web Services\sys_MiscellaneousParameters.xsd
<b>TargetNamespace:</b>	http://www.percussion.com/schemas/sys_MiscellaneousParameters.xsd
<b>Elements</b>	
<i>CallDirectRequest</i> (see " <a href="#">Call Direct</a> " on page 107)	
<i>CheckInRequest</i> (see " <a href="#">Check In</a> " on page 105)	
<i>CheckOutRequest</i> (see " <a href="#">Check Out</a> " on page 102)	
<i>LockRevisionRequest</i> (see " <a href="#">Lock Revision</a> " on page 104)	
<i>LoginRequest</i> (see " <a href="#">Login</a> " on page 101)	
<i>LogoutRequest</i> (see " <a href="#">Logout</a> " on page 106)	

## Login

This function retrieves a Rhythmyx session ID and Community ID for the user, which are used with the credentials on all subsequent function calls.

It is used to log a user into Rhythmyx. It should always be the the first function in a Web Services session with Rhythmyx.

### Schema sys\_MiscellaneousParameters.xsd

    </Roles>
    <Locales>
      <Locale code="en-us">US English</Locale>
    </Locales>
  </LoginData>
</LoginResponse>
</SOAP-ENV:Body>
```

## Errors

- Unrecognized user name or password (Error Code: 9020)  
<com:Result errorCode="9020" type="failure">Authentication failed. The following messages were returned from the providers: The security provider &quot;BackEndTable/rxmaster&quot; could not authenticate user &quot;adniml&quot;. The security provider &quot;OS/.&quot; could not authenticate user &quot;adniml&quot; : LogonUser: Logon failure: unknown user name or bad password.</com:Result>

## Check Out

This function checks out the Content Item specified.

It is equivalent to selecting *Workflow* > *Checkout* in Content Explorer. It is used when a user wants to check out a Content Item for editing.

If the value of the checkOut flag is true, Rhythmyx checks the Content Item out to the user issuing the request. If the value of the revision parameter of the Content Key is -1, Rhythmyx checks out the tip Revision. If the value of the revision parameter is any other value, Rhythmyx checks out the specified revision and promotes it to the tip revision. (This combination provides the same effect as the **Promote Revision** (on page 22) function.)

## Schema `sys_MiscellaneousParameters.xsd`

    </CheckOutRequest>
  </checkOut>
</s:Body>
```

### Example Request Reponse Body

See *Result Response (Successful Response)* (on page 114).

### Errors

- Item cannot be checked out: may occur for a number of reasons; for example:
 

```
<com:Result errorCode="1011" type="failure">An error occurred
while pre-processing the request submitted by the host
10/10.10.32. An exception occurred while processing the
"Java/global/percussion/workflow/sys_wfPerformTransition"
; extension: com.percussion.workflow.PSCheckInCheckOutException:
You can not check out when it is checked out by somebody. (error
code 1,108)</com:Result>
```

- No match for Content Key (Error Code: 14001)  
`<com:Result errorCode="14001" type="failure">Content item not found, contentId = 302, revision = 1.</com:Result>`

## Lock Revision

This function sets the Lock flag for the specified Content Item. When the Lock flag is set, Rhythmyx creates a new Revision each time the Content Item is updated, even if it has not yet gone Public.

This function is used when you want to set the Revision Lock on a Content Item manually. (By default, the Revision Lock is set when the Content Item goes Public.)

The ContentKey specifies the Content Item for which to set the flag. The contentId attribute of ContentKey must match an existing Content Item.

### Schema sys\_MiscellaneousParameters.xsd

    </LockRevisionRequest>
  </lockRevision>
</s:Body>
```

## Example Request Reponse Body

See *Result Response (Successful Response)* (on page 114).

## Errors

- No match for Content Key (Error Code: 14001)  

```
<com:Result errorCode="14001" type="failure">Content item not found, contentId = 302, revision = 1.</com:Result>
```

## Check In

This function checks in the specified Content item WITHOUT updating its data. If the user has updated the item, the record in the Repository will reflect the most recent changes that were updated. However, even though no changes are made to the data, the audit and Revision History trails include both the Check Out and Check In actions.

This function is used to check in a Content Item when a user has finished editing it.

This function is equivalent to selecting *Workflow > Checkin* in Content Explorer.

The ContentKey specifies the item to check in.

## Schema sys\_MiscellaneousParameters.xsd

## Result Response (Successful Response)

Several Rhythmyx Web Services methods return either a success or failure response. Failure responses are listed in the **Error** section for each method. For a number of methods, the only alternative response is a report of success. The following code illustrates the success response.

```
<com:ResultResponse type="success"
xmlns:com="urn:www.percussion.com/webservices/common">
  <com:Result errorCode="0" type="success"/>
</com:ResultResponse>
```

# Implementing a Custom Rhythmyx Web Services Function

Most Rhythmyx Web Services functions provide predefined functionality. If you want to provide custom functionality, in particular if you want to call directly to a Rhythmyx application to return data, use the Call Direct function. Rhythmyx Web Services includes this function specifically to permit you to call directly to Rhythmyx application.

To implement a custom Web Services function:

- 1** Create a custom Rhythmyx application to generate the data you want to retrieve for Web Services.
- 2** This step is necessary if you want to call data not available from an existing Rhythmyx application, or if the application you want to call uses HTML parameters to specify the data to retrieve. SOAP messages are XML documents, so you must pass the request parameters for Web Services as XML fields rather than as HTML parameters.
- 3** Create the SOAP message to retrieve the Rhythmyx CMS data. The SOAP message must call the Call Direct function. The Call Direct function call includes a parameter specifying the Rhythmyx application to use to generate the data you want to retrieve.

---

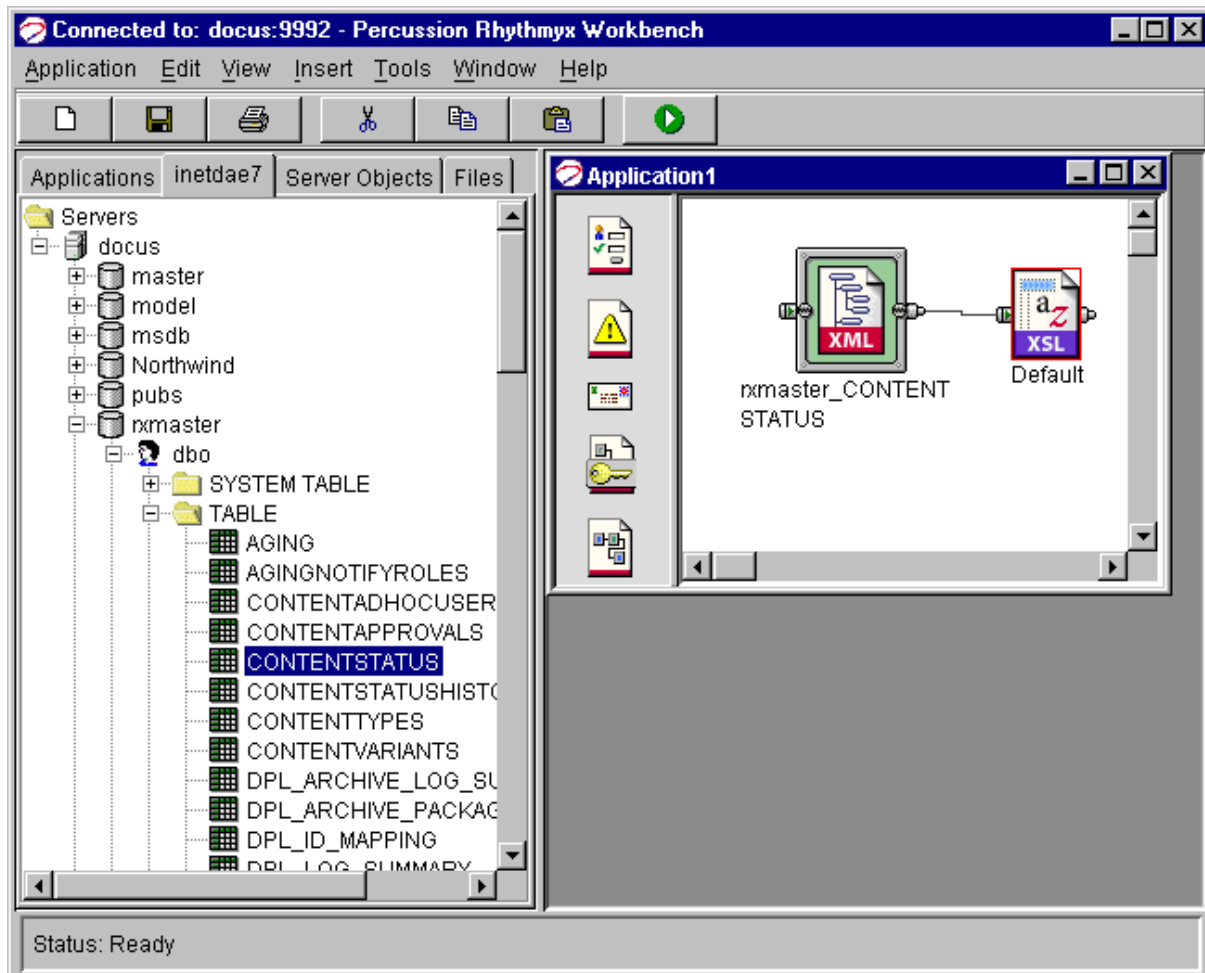

## Example Web Services Rhythmyx Application

In this example, we will create a Rhythmyx application that will return Content Status information based the Content ID and the RevisionID, which will be included as parameters on the request XML document. To create the application:

- 1 In the Rhythmyx Workbench, create a new application (in the Menu bar, choose *Application > New*).
- 2 Choose the data tab for your database. (If you do not already have a data tab, see "Adding Drivers and Servers" in the Rhythmyx online Help).
- 3 Create a Resource based on the CONTENTSTATUS table.
  - a) On your data tab, expand your Rhythmyx database until you can see your tables.
  - b) Click on the CONTENTSTATUS table and drag it to the new application.
  - c) On the pop-up menu, choose *Query*.

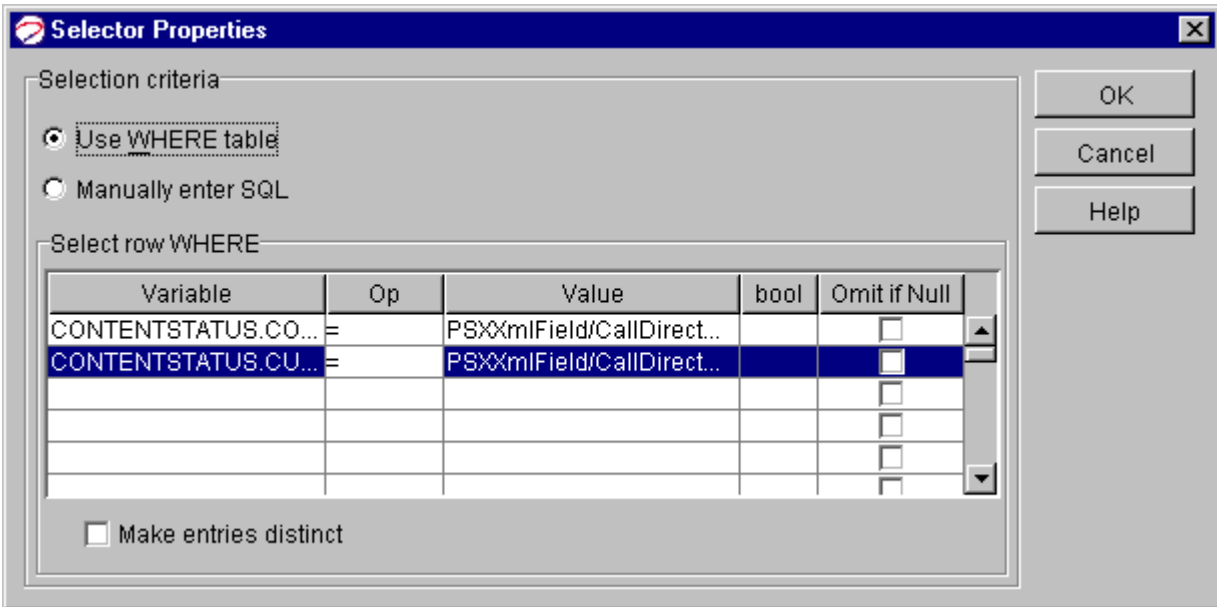

This graphic shows the results of the process. Note that the CONTENTSTATUS table, which was used to create the query, is still selected.

- 4 Create Selector parameters that will query data based on the data passed in the Web Services request (in this case, contentId and revisionId).
  - a) Double-click on the resource to open the Resource Editor.
  - b) In the Resource editor, double-click on the Selector icon on the datapipe.
  - c) In the Selector Properties dialog, click in the first row under the **Variable** column, and click on the browse button.
  - d) In the Value Selector dialog, click the drop arrow in the **Type** field and choose *Backend Column*.
  - e) From the list of backend columns, choose CONTENTSTATUS.CONTENTID.
  - f) Click in **Op** column in the same row and choose the equals sign (=).
  - g) Click in the same row of the **Value** column and click the browse button.
  - h) In the Value selector dialog, click the drop arrow in the Type field and choose *XML Element*.

- i) In the Value field, enter CallDirectRequest/contentId.
- j) Repeat the steps for the next row, using the following data:

Variable	Op	Value
CONTENTSTATUS.CURRENTREVISION	=	PSXmlField/CallDirectRequest/revisionId

- k) Click [OK] to save the Selector.

- 5 Double-click the mapper icon.
- 6 Rhythmyx automatically maps all columns to a default DTD. Delete the columns you do not want to return from the request by selecting the column and clicking [Remove].
- 7 Save and run the application.

To invoke this application, you would use the Call Direct method. The `AppLocation` element would specify the application and resource you want to invoke. The `<Params>` element specifies the parameters used in the application. The `name` attribute of each `<Param>` child element specifies the name of the parameter, while the value the element specifies the value of the parameter.

## CHAPTER 5

# Troubleshooting Rhythmyx Web Services

Rhythmyx Web Services errors fall into two general classes, expected responses and unexpected responses. Expected responses are errors generated when processing the request SOAP message. Unexpected responses indicate that the SOAP message was not received for processing.

## Unexpected Responses

Unexpected responses may result in one of the following messages:

### Connection Refused

You may receive this response in two ways.

In most cases, you will receive it as a standard response, such as the following XML:

```
<?xml version="1.0" encoding="UTF-8"?>
<SOAP-ENV:Envelope xmlns:SOAP-
ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org
/2001/XMLSchema">
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Client</faultcode>
      <faultstring>IOException Connection refused:
connect</faultstring>
      <faultactor>/soap/servlet/messagerouter</faultactor>
      <detail>
        <stackTrace>[SOAPException: faultCode=SOAP-ENV:Client;
msg=IOException Connection refused: connect]
          at
com.percussion.hooks.webservices.PSWebServices.sendToServer(PSWebService
s.java:207)
          at
com.percussion.hooks.webservices.PSWSMiscellaneous.login(PSWSMiscellaneo
us.java:130)</stackTrace>
      </detail>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

In this case, the Rhythmyx server is not running. Start the Rhythmyx server.

You may also receive a "connection refused" message such as the following:

```
Exception in thread "main" [SOAPException: faultCode=SOAP-ENV:Client;
msg=Error opening socket: java.net.ConnectException: Connection refused:
connect;
targetException=java.lang.IllegalArgumentException:
Error opening socket: java.net.ConnectException: Connection refused:
connect]
  at
org.apache.soap.transport.http.SOAPHTTPConnection.send(SOAPHTTPConnectio
n.java:354)
    at org.apache.soap.messaging.Message.send(Message.java:123)
    at samples.messaging.SendMessage.main(SendMessage.java:58)
```

You may receive this message for one of two reasons:

- Your Web application server is not running. Start the Web application server.
- Your web.xml file is not configured properly. See *Configuring Rhythmyx Web Services* (on page 8) for details about the correct configuration of this file.

In this case, your Web application server is not running. Start your Web application server.

## Server Unavailable

The "server unavailable" XML resembles the following:

```
<?xml version="1.0" encoding="UTF-8"?>
<SOAP-ENV:Envelope xmlns:SOAP-
ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org/2001/XMLSchema">
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Client</faultcode>
      <faultstring>HTTPError code=503 Service
Unavailable</faultstring>
      <faultactor>/soap/servlet/messagerouter</faultactor>
      <detail>
        <stackTrace>[SOAPException: faultCode=SOAP-ENV:Client;
msg=HTTPError code=503 Service Unavailable]
          at
com.percussion.hooks.webservices.PSWebServices.sendToServer(PSWebService
s.java:181)
          at
com.percussion.hooks.webservices.PSWSMiscellaneous.login(PSWSMiscellaneo
us.java:130)</stackTrace>
      </detail>
    </SOAP-ENV:Fault>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

This message indicates that the Rhythmyx server is still starting and is not ready to receive SOAP requests. Wait a couple of minutes for the Rhythmyx server to finish initializing.

## Service Unknown

The "service unknown" XML resembles the following:

```
<?xml version="1.0" encoding="UTF-8"?>
<SOAP-ENV:Envelope xmlns:SOAP-
ENV="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org
/2001/XMLSchema">
  <SOAP-ENV:Body>
    <SOAP-ENV:Fault>
      <faultcode>SOAP-ENV:Server</faultcode>
      <faultstring>service
'urn:www.percussion.com/webservices/miscellaneous';
unknown</faultstring>
```

```
<faultactor>/soap/servlet/messagerouter</faultactor>  
</SOAP-ENV:Fault>  
</SOAP-ENV:Body>  
</SOAP-ENV:Envelope>
```

This message indicates that the requested service is unregistered. Check the registration of the service. Confirm that the service you are requesting exists. The service is the last element of the namespace listing the unknown service; in this example, "miscellaneous". To check that a service is registered or exists, enter the following URL in a browser:

```
http://localhost:9980/RxServices/admin/list.jsp
```

Where localhost is the name of the machine where your Rhythmyx server resides and 9980 is the port of the application server. You should see the following listing:

## Service Listing

Here are the deployed services (select one to see details)

- [urn:www.percussion.com/publisher](http://www.percussion.com/publisher)
- [urn:www.percussion.com/webservices/search](http://www.percussion.com/webservices/search)
- [urn:www.percussion.com/webservices/contentmeta](http://www.percussion.com/webservices/contentmeta)
- [urn:www.percussion.com/webservices/workflow](http://www.percussion.com/webservices/workflow)
- [urn:www.percussion.com/webservices/miscellaneous](http://www.percussion.com/webservices/miscellaneous)
- [urn:www.percussion.com/webservices/contentdata](http://www.percussion.com/webservices/contentdata)
- [urn:www.percussion.com/webservices/assembly](http://www.percussion.com/webservices/assembly)
- [urn:www.percussion.com/webservices/design](http://www.percussion.com/webservices/design)
- [urn:www.percussion.com/webservices/folder](http://www.percussion.com/webservices/folder)

If you do not see all of the services in this listing, register the services again. For details about registering services, see “*Appendix II: Configuring Rhythmyx Web Services*” (on page 129).

---

## Expected Responses

Expected responses are errors generated while processing a SOAP request message. These responses generally indicate that Rhythmyx could not process the response for some reason.

Most expected responses are generated when a request message requests missing or incorrect data, such as requesting a Content ID that does not exist. For an example of such a message see [Web Services Error Response SOAP Message](#).

Expected responses can also be generated if your request message is invalid because it does not conform to the Rhythmyx Web Services schemas. For example:

```
<?xml version='1.0' encoding='UTF-8'?>
<SOAP-ENV:Envelope xmlns:SOAP-
ENV="http://schemas.xmlsoap.org/soap/envelope/" xm
lns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns:xsd="http://www.w3.org
/2001/XMLSchema">
  <SOAP-ENV:Header>
    <HeaderResponse/>
  </SOAP-ENV:Header>
  <SOAP-ENV:Body>
    <OpenItemResponse
xmlns="urn:www.percussion.com/webservices/contentdata">
      <com:ResultResponse type="failure"
xmlns:com="urn:www.percussion.com/webservices/common">
        <com:Result errorCode="2002" type="failure">A "ContentKey"
XML element was expected but a "ContentItem" XML element was found
instead.</com:Result>
      </com:ResultResponse>
    </OpenItemResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

In this case, the submitted message included an incorrect element, "ContentItem" instead of "ContentKey". When you receive such messages, confirm that the XML you submitted was valid.

# Appendices

---

## Appendix I: Invoking Rhythmyx Web Services

The following example code demonstrates how to invoke Rhythmyx Web Services in Java. For this code to run correctly, the following .jar files must be in the CLASSPATH:

- Activation.jar
- mail.jar
- soap.jar
- xercesImpl.jar
- xmlParserAPIs.jar

```
package samples.messaging;

import java.io.*;
import java.net.*;
import javax.activation.*;
import javax.mail.internet.*;
import javax.xml.parsers.*;
import org.w3c.dom.*;
import org.xml.sax.*;
import org.apache.soap.*;
import org.apache.soap.messaging.*;
import org.apache.soap.transport.*;
import org.apache.soap.util.xml.*;
import org.apache.soap.util.mime.*;

public class SendMessage
{
    public static void main (String[] args) throws Exception
    {
        if (args.length < 2)
        {
            System.err.println ("Usage: java " + SendMessage.class.getName
() + " SOAP-router-URL envelope-file");
            System.exit (1);
        }

        // get the envelope to send
        FileReader fr = new FileReader (args[1]);
        DocumentBuilder xdb = XMLParserUtils.getXMLDocBuilder();
        Document doc = xdb.parse (new InputSource (fr));
        if (doc == null)
        {
```

```
        throw new SOAPException (Constants.FAULT_CODE_CLIENT, "parsing
error");
    }
    Envelope msgEnv = Envelope.unmarshall (doc.getDocumentElement ());

    // send the message
    Message msg = new Message ();

    // Add attachments.
    for (int i = 2; i < args.length; i++)
    {
        ByteArrayDataSource ds = new ByteArrayDataSource(new
File(args[i], null);
        DataHandler dh = new DataHandler(ds);
        MimeBodyPart bp = new MimeBodyPart();
        bp.setDataHandler(dh);
        bp.setFileName(args[i]);
        bp.setHeader(org.apache.soap.Constants.HEADER_CONTENT_LOCATION,
"thefile" + (i - 2));
        msg.addBodyPart(bp);
    }
    msg.send (new URL (args[0]), "urn:this-is-the-action-uri",
msgEnv);

    // receive whatever from the transport and dump it to the screen
    System.out.println ("RESPONSE:");
    System.out.println ("-----");
    SOAPTransport st = msg.getSOAPTransport ();
    BufferedReader br = st.receive ();
    String line;
    while ((line = br.readLine ()) != null)
    {
        System.out.println (line);
    }
}
}
```

---

## Appendix II: Configuring Rhythmyx Web Services

You may need to configure Rhythmyx Web Services in the following circumstances:

- You want to deploy Web Services to another J2EE servlet container, (such as a portal).
- You have deleted the Web Services SOAP service registration from your J2EE servlet container.

To configure Rhythmyx Web Services, run the file `registerWS.bat` (<registerWS\_sh>).

If you have deployed Web Services to another J2EE servlet container, you will need to modify the file to point to the correct location. To modify the file:

- 1** Open the file in a simple text editor such as Notepad or vi.
- 2** Find the following line:  
`echo eg: http://localhost:8080/RxServices/servlet/rpcrouter`
- 3** Change `localhost` to match the name of the machine where your J2EE servlet container is located.

Change `8080` to match the port of your J2EE servlet container.
